

# Chapter 6 Probability

6.1-6.3

March 22, 2016

# Coin Tosses

An experiment consists of tossing a coin 3 times and observing the result as a sequence of heads and tails.

- Let  $E$  be the event: More heads than tails occur.
- Let  $F$  be the event: The first toss is a head.

- ① What is the sample space for the experiment?
- ② Are the events  $E$  and  $F$  mutually exclusive?
- ③ Does the event  $(T, H, H)$  belong to the event  $E \cup F$ ?

# Dice

Consider the experiment in which a 6-sided dice is rolled three times, and the result is recorded as a sequence.

- For example, one possible outcome is  $(1, 4, 3)$ .
- Suppose that  $E$  is the event: At least two of the rolls are the same.

- ① How large is the sample space?
- ② Describe the complement of  $E$ .

# Probabilities

| Outcome  | Probability |
|----------|-------------|
| $s_1$    | $p_1$       |
| $s_2$    | $p_2$       |
| $\vdots$ | $\vdots$    |
| $s_n$    | $p_n$       |

This table is called the **probability distribution** for the sample space  $S = \{s_1, s_2, \dots, s_n\}$

## Example

Is this a probability distribution?

| Outcome | Probability |
|---------|-------------|
| $s_1$   | .3          |
| $s_2$   | .2          |
| $s_3$   | .4          |
| $s_4$   | .2          |

## Example

Is this a probability distribution?

| Outcome | Probability |
|---------|-------------|
| $s_1$   | .2          |
| $s_2$   | .2          |
| $s_3$   | .7          |
| $s_4$   | -.1         |

## Example

Is this a probability distribution?

| Outcome | Probability |
|---------|-------------|
| $s_1$   | .2          |
| $s_2$   | 0           |
| $s_3$   | .7          |
| $s_4$   | .1          |

## Example

An experiment with outcomes  $s_1, s_2, s_3, s_4$  has the following probability distribution:

| Outcome | Probability |
|---------|-------------|
| $s_1$   | .1          |
| $s_2$   | .6          |
| $s_3$   | .1          |
| $s_4$   | .2          |

Let  $E = \{s_1, s_2\}$  and  $F = \{s_2, s_4\}$ .

- 1 Determine  $Pr(E)$ .
- 2 Determine  $Pr(F')$ .
- 3 Determine  $Pr(E \cap F)$ .
- 4 Determine  $Pr(E \cup F)$ .

## Example

A factory needs two raw materials to operate.

- The probability of event  $E$  = having an adequate supply of material  $A$  is .95.
- The probability of  $F$  = having an adequate supply of material  $B$  is .97.
- The probability that the factory has an adequate supply of either material  $A$  or material  $B$  is .99.

**What is the probability that the factory can operate?**

# Compute Probability

An experiment consists of tossing a coin 3 times and observing the result as a sequence of heads and tails.

- Let  $E$  be the event: More heads than tails occur.
  - Let  $F$  be the event: The first toss is a head.
- ① Assuming that all outcomes are equally likely, what is  $Pr(E)$ ?  
 $Pr(F)$ ?

# Compute Probability

Consider the experiment in which a 6-sided dice is rolled three times, and the result is recorded as a sequence.

- For example, one possible outcome is  $(1, 4, 3)$ .
- Suppose that  $E$  is the event: At least two of the rolls are the same.
- The probability of  $E$  is...
